

GPS Ranger

Operating costs are a sensitive issue in the transport business, and Global Positioning System (GPS) technology is therefore a blessing for fleet managers looking to maximize the efficiency of their daily operations. The GPS Ranger is a compact unit that can be located and re-located in different vehicles and allows you to monitor all resultant location data from your office with the use of the Google Earth™ computer application. The Ranger will record the trip start time and location, all stops along the way and the duration of each stop, maximum speed and the entire trip path. The GPS Rangers means you are quite literally “on top” of your fleet and, with up to six months of location data storage capacity, there’s nothing that will escape your watch.
